CREOSOTE OIL

THE STANDARD WOOD PRESERVATIVE

Any quantity in drums and tank cars from all plants; also in barges and tankers from Newark, Norfolk, Mobile and Seattle.

TRANSOTE

A highly refined, scientifically blended transparent wood preservative which provides a colorless treatment for the preservation of wood against decay and insect attack. TRANSOTE treated wood is dry—not oily—and after a short aeration period is practically odorless. It can be glued, painted, varnished or finished in any desired manner.

DDT (DICHLORO-DIPHENYL-TRICHLORO-ETHANE)

$(ClC_6H_4)_2CHCCl_3$. Colorless cryst, m.p. 89° C. Sol. Freon, kerosene, hydrocarbon solvents; insol. water. Technical DDT is a mixture of several isomers and reaction by-products, although the main constituent is 2,2-bis (p-chlorophenyl)—1,1,1-trichloroethane. The melting point is consequently dependent upon the preponderance of the latter isomer, and some military specifications call for a higher setting point. Uses—insecticide active ingredient. Grades—tech. aerosol and purified.

Celite DIATOMACEOUS EARTH

The Johns-Manville deposit of diatomaceous earth at Lompoc, California, is the largest and purest known. It is the source of many Celite products which have wide application in the chemical and process industries.

CELITE FILTER AIDS provide maximum flow rates with required clarity in the filtering of scores of products, from sugar and syrups to drugs and lubricants.

CELITE MINERAL FILLERS, used in many industrial processes, provide high absorption, light weight, large surface area, low refractive index and superior suspension.

DIISOBUTYLENE

Colorless liquid at room temperature and atmospheric pressure. Used in manufacture of isobutylene and polyisobutylene. Intermediate in preparing other chemicals.

TRIISOBUTYLENE

Clear, colorless liquid at room temperature and atmospheric pressure. Useful as an intermediate for the preparation of many chemical compounds.

TETRAPROPYLENE

Consists mainly of the tetramer, with small percentages of C_{18}, C_{14}, and C_{30} olefins. Most useful for the alkylation of such aromatic hydrocarbons as benzene, toluene, xylene, and naphthalene, and of phenolic materials such as phenol and cresol. A preferred material in a number of synthetic methods for making higher alcohols, mercaptans, alkyl halides, and other widely used products.

DILUENTS LACQUER

Active resin solvents which assist in the blending and compounding of specific resins with the nitrocellulose, cellulose, or other ingredients, thus modifying flow and vaporization characteristics. The more commonly used are benzol, toluol, xylol, various organic solvents, and petroleum solvents, specially fractionated for the lacquer industry. Products are specially treated in order that traces of objectionable nauseous odors are removed, as well as corrosive constituents. Grades—Light Fraction: This is used to replace benzol, all or in part, in fast drying lacquers. Rate of evaporation is similar to that of benzol. Medium Fraction: This is used to replace toluol, all or in part, in spraying lacquers for the automobile and furniture trade. Rate of evaporation is similar to that of toluol. Heavy Fraction: This is used to replace xylol, all or in part, in slower drying lacquers. Rate of evaporation is similar to that of xylol. Very Heavy Fraction: This is used in brushing lacquers for the architectural field. Evaporation rate is roughly similar to that of turpentine.

dioctyl phthalate (DOP)

• Eastman offers dioctyl phthalate with an exceptionally low color and of uniform and dependable quality in both an electrical and a non-electrical grade. DOP is probably the best all-purpose plasticizer known for polyvinyl resins and also finds use with a wide variety of other materials, including polymethyl methacrylate, the cellulosics and synthetic rubber. Available in drums, compartmented and full tank cars.

$(C_6H_5)_2CO_3$. M.W. 214. White crystalline solid. M.P. 78°C. B.P. 302°C.; 168°C. (15 mm). Insoluble in water, soluble in hot alcohol, ether, acetic acid, acetone, and most aromatic solvents. Volatility of 22.0% compared with 100% for camphor. Compatible with cellulose acetate, effecting ready solution to form a clear and uniform plastic comparable to that formed with camphor. It is similarly recommended for ethyl cellulose plastic. Forming odorless and less combustible plastic with nitro cellulose, it lends itself for substitution of up to 50% of the camphor content of such plastics.

DYES AZO

The important feature of the production of azo dyes is the formation of a diazonium compound from one intermediate, and the coupling of this with another intermediate.

DYES BASIC

Derived from ammonia by replacement of one or more hydrogen atoms of one or more molecules of ammonia with various other elements or groups of elements. Basic in character, hence the name. Combine readily with silk and wool without aid of mordants, producing brilliant shades. Used on leather, paper and various textile fibers.

DYES CHROME

Intermediate in character between acid and mordant colors. Resemble acid colors in that they may be dyed directly upon wool in an acid bath and at the same time resemble the mordant colors in that they may be dyed upon metallic mordants. Used extensively on men's and women's wear. Possess good fastness to light, acids, washing, perspiration, spotting, etc.

GENERAL DYESTUFF CORPORATION

435 HUDSON STREET • NEW YORK 14, N.Y.

BOSTON • CHARLOTTE • CHICAGO • PHILADELPHIA • PROVIDENCE • SAN FRANCISCO

In addition to our vast range of dyestuffs we offer an extensive range of detergents, emulsifying, dispersing, foaming, wetting-out, water softening and organic sequestering agents for the Textile, Paper, Leather, Lake, Plastic, Rubber, Agricultural, Chemical and Soap industries. Our Technical Department will be glad to co-operate with you in supplying information on the newest developments in the use of these products.

TEXTILES

Bionol and Biopal: Quaternary germicides and germicidal detergents.

Colloresines: Gum substitutes (cellulose ethers).

Diazopon: Dyeing assistant for Naphthols.

Emulphors: Emulsifying agents for mineral oils, fatty acids and waxes.

Eulan CN: Permanent moth-proofing agent.

Igepals: Wetting and scouring agents for all fibers; non-exhausting wetting agents for wool carbonizing; non-ionic dispersing agents.

Igepons: Scouring agents for wool, cotton and all other fibers; dyeing assistants and wetting agents.

Leonil O: Degreases wool in an acid bath.

Nekals: Quick acting penetrating agents for wetting-out and rewetting.

Nullapons: Lime sequestering agents which soften water by formation of complex ions.

Peregals: Levelling and stripping agents for vat dyeing.

Prestabit Oils: Highly sulphonated stable oils for level dyeing and finishing.

Preventols and Puratized: Mildew proofing compounds.

Protectols: Protective agents for wool processing, dyeing and stripping.

Ramasits and Ramasols: Water repellent compounds.

Soromines: Cation and anion active finishes and dye fixing agents.

PAPER

Blancol Conc. Powder: For improved sizing, increased filler retention, prevention of pitch coagulation and elimination of foam specks.

Colloresines: Fc .mproved grease and oil resistance and for improved gloss-ink printing.

Emulphor ELA: Leveling agent for basic and acid dyes in calender coloring.

Igepal CA Extra: Detergent and scouring agent for de-inking and cleaning wool felts.

Katanol W: Mordant for bleed-proofing basic calender stains.

Nekal BX: Wetting-out agent for new felts and conditioning felts in use.

Preventols: Non-toxic slime control and mildew-proofing agents.

Puratized—Gallicide: Mercuric compounds for slime control.

LEATHER

Blancol Conc. Powder: Syntan for bleaching chrome tanned leathers and as buffer and resist in dyeing pastel shades.

Colloresines: Adhesive agents for pasting leather.

Corial Bottom: For water repellent leather finishes.

Emulphors: Wetting, emulsifying and dispersing agents used extensively in pickle degreasing and in flaming.

Igepons: For fatliquor emulsifying in hard water and clearing preliminary to dyeing.

Implenal: Chrome tanning aid which imparts greater plumpness to the leather, especially in the flanks.

Neutrigan: For neutralizing chrome tanned leathers.

Preventol I Liquid: For disinfecting and preventing mold in leather.

Tanigan Supra DLNA: Syntan with tanning and filling action for retanning and bleaching chrome tanned leathers.

SOAP COMPOUNDERS

Igepals: Non-ionic synthetic detergents.

Igepons: Anionic synthetic detergents.

Nullapons: Organic sequestering agents.

Blancophors: Optical whitening agents.

RUBBER

Emulphor ON: Emulsifying and dispersing agent for stabilizing latex.

Igepons: Wetting agents for latex.

AGRICULTURAL

Emulphors: Emulsifying agents.

Igepal No. 300: Emulsifier for DDT, 2,4D, Chlordane, etc.

Igepons: Wetting agents for sulphur, insecticides and fungicides.

Nekals: Wetting agents for sulphur, insecticides and fungicides, and for fruit washing.

DYES, NATURAL

Substances derived from natural sources in contrast with synthetically produced dyes. Employed for special purposes. Produced by some form of extraction, usually water, followed by a concentration. See Annatto, Chorophyll, Cochineal, Cutch, Fustic, Indigo, Logwood Extract, Madder, Nutgalls, Osage Orange Extract, Quercitron Bark, Turmeric, etc.

ENZYMES

Catalysts of organic and usually colloid nature having a specific action. They are formed by living cells but are usually independent of the presence of the latter in their operation. Uses: produce hydroysis (decompose fats, convert aldehydes into a mixture of acid and alcohol, invert sugars, digest proteins), coagulate (clot blood, curdle milk), reduce or decompose (lactic acid and alcohol fermentations), oxidize (convert alcohol into acetic acid.)

ethyl acetate

● Eastman ethyl acetate is an excellent fast-evaporating solvent for use in lacquers, varnishes, paints and pyroxylin plastics. It may be employed as a process solvent in the manufacture of drugs, perfumes and various chemical intermediates.

Eastman ethyl acetate is normally furnished with ST-115 as denaturant, but special denaturants can be supplied on request. Available in drums, compartmented and full tank cars.

ETHYL ACETATE

Ethyl Acetate . . . one of the most widely used nitrocellulose solvents . . . is supplied by Carbide and Carbon Chemicals in three grades: a 99 per cent grade, a 95 to 98 per cent grade, and an 85 to 90 per cent grade. Ethyl Acetate can be supplied in 55-gallon containers, compartments, and straight tank cars.

FATTY ACID ESTERS

GRaceland 7-3030

FATTY ACID ESTERS

Various esters of the fatty acids, such as stearic, oleic, linoleic, ricinoleic, etc. The fatty acids are produced by the removal of the glyceride content from neutral oils and fats, either by chemical or mechanical means. The resultant fatty acids are then distilled under vacuum of varying degrees and varying temperatures.

FILLERS, PAPER

Except in high quality papers it is customary to add to the pulp a relatively cheap mineral loading material to provide bulk and also in many instances to help fill the pores. Most commonly used, and often called "loaders" are: china clay, clays, calcium sulfate. See Clays, Paper-Maker's; also Kaolin, China Clay, Calcium Sulfate, etc.

FILLERS, PLASTIC

The use of filling materials, which include cellulose, asbestos, fabric, paper, etc., is for the value given by the special properties of these materials, better molding qualities, greater toughness and strength, and, in the case of mineral fillers, an increased degree of water and heat resistance. Wood flour is one of the most common of fillers employed. Further, mineral filled molding materials also have a lower coefficient of heat expansion and lower shrinkage in the molding operation which in some instances is an advantage. See also pitches of various types.

FLOTATION AGENTS

Chemicals and specially compounded products used in ore treating to float the minerals in a froth permitting separation from the ore pulp. Oil and oily substances were the first flotation agents. With the introduction of selective flotation xylidine, alphanaphthalamine, thiocarbanilide, orthotoluidine, certain of the thioureas, potassium xanthate, sodium xanthate, certain of the amyl compounds, cresylic acid, pine oil, etc., were utilized.

FLOTATION AGENTS

For greater productivity and more effective separation, investigate Armour's specification chemical reagents.

Armour's cationic reagents include the ARMEENS (high molecular weight aliphatic amines) and their water-soluble acetate salts (the ARMACS), as well as the ARQUADS (quaternary ammonium salts). Armour's anionic reagents are the NEO-FATS (special fractionally-distilled fatty acids). All are available in commercial quantities.

GLYCINE—see Acid, Aminoacetic

GLYCOL DIACETATE

$C_6H_{10}O_4$. M.W. 146.14. Water-white liquid. B.P. 186°C. Uses—Solvent for cellulose esters and ethers, for printing inks and lacquers, and for resins; plasticiser; perfume fixative; prevents blushing in airplane dopes; imparts flexibility to cellulose ether films.

★†Carbide & Carbon Chems Div, Union Carbide & Carbon Corp, 30 E 42 St, N Y	Murray Hill 7-8000

GLYCOL DIFORMATE (Ethylene Glycol Diformate, Ethylene Formate)

$HCOOCH_2CH_2OOCH$. M.W. 118.09. As supplied commercially is a mild-odored, water-white liquid, soluble in water, alcohol, and ether. This ester boils at 177°C. under 760 mm. pressure and has a specific gravity of 1.2240 at 20/20°C. Like glycol diacetate, it is a solvent for cellulose acetate, nitrocellulose, and cellulose ethers. In the presence of water, glycol diformate will hydrolyze slowly with the liberation of formic acid. Hence, it can be employed in reactions where it is desired to develop a gradual source of this acid. It shows promise as an ingredient of embalming fluids.

hydroquinone TECQUINOL

● Tecquinol (Eastman technical hydroquinone) is an economical raw material for many organic syntheses. It reacts readily with amines to yield p-aminophenols and p-phenylenediamines of high quality. Condensation with phthalic and other anhydrides occurs readily. Because of its reduction potential, it is very useful as a polymerization inhibitor for many monomers. Likewise, it is one of the most satisfactory arresters for peroxide-catalyzed polymerizations. Available in fiber-drum lots.

NITRILES FROM FATS

The ARNEELS are a series of 11 high molecular weight aliphatic nitriles having alkyl chain lengths of 8 to 18 carbon atoms.

The ARNEELS are available in commercial quantities for use in detergents, wetting agents, plasticizers for synthetic rubber and plastic products, rust preventatives, waterproofing compounds, chemical synthesis.

2,5-dimethoxy aniline and 2,5-diethoxy aniline

• These Eastman aniline derivatives are used in several interesting dye formations. When diazotized, they can be coupled with salicylic acid to produce chrome yellows. Oil colors or pigments are readily produced by coupling the diazotized dialkoxy anilines with such intermediates as beta-naphthol, beta-naphthylamine, phenol diethanolamine, and phenyl ethyl ethanolamine. Acid eosines are produced by coupling the diazotized dialkoxy anilines with such reactants as the naphthol sulphonic acids. Coupling either aniline derivative with diazotized sulphanilic acid and treating with phosgene produces cotton fast-to-light direct colors. Both available in 35-pound cans and in drum lots.

Carbonyl Iron Powders

Remarkably pure form of iron produced by heating liquid iron pentacarbonyl to temperature where it decomposes into iron in powdered form, liberating CO. Iron particles formed are all spheres, absolutely free of non-ferrous materials. Produced in various particle sizes at Grasselli, N. J., and Huntsville, Ala.

isopropyl acetate

● Eastman isopropyl acetate offers the lacquer formulator a low-cost solvent similar in properties to ethyl acetate. Because of its higher boiling range, it is a somewhat slower-evaporating solvent and, thus, is in demand for blush-resistant formulations.

The good solvent properties of isopropyl acetate indicate a wide utility for this material in the chemical process industries. Available in drums, compartmented and full tank cars.

LIME HYDRATED CHEMICAL (Calcium Hydroxide, Calcium Hydrate, Slaked Lime)

A dry powder obtained by treating quicklime with water enough to satisfy its chemical affinity for water under the conditions of its hydration. It consists essentially of calcium hydroxide or a mixture of calcium hydroxide, magnesium oxide and magnesium hydroxide.

Its principal chemical uses are in general the same as listed under lime (Quicklime). The A.S.T.M. specifications mentioned under quicklime also cover hydrated lime in most instances.

Hydrated lime is shipped in numerous sizes of paper and cloth bags (50 pounds generally) and also in bulk to water treating plants and other users of large quantities. Regular and superfine terms are used to designate differences in the fineness or particle size of hydrated limes.

LIME (Quicklime), Chemical

A calcined material, the major part of which is calcium oxide or calcium oxide in natural association with a lesser amount of magnesium oxide, capable of slacking with water. Contains also small quantities of silica, iron and aluminum oxides, and other impurities. Quicklime is produced by burning limestone or dolomite in shaft or rotary kilns. When exposed to the air for a considerable period of time, quicklime will absorb moisture and carbon dioxide. It first changes to calcium hydroxide, or hydrated lime, and later the exposed portion will unite with carbon dioxide from the air to form calcium carbonate, and thus the lime will lose some of its chemical activity for certain purposes. To prevent deterioration in storage quicklime is packed in steel drums or tight wooden barrels containing 180 or 280 lbs., and in waterproof multiwall paper bags or paper-lined burlap bags containing amounts of quicklime which vary among the different companies, usually about 80 lbs. Quicklime is shipped also in bulk.
Its principal chemical uses include the following: as a fluxing agent, and for wire drawing, pickling, annealing, and pig casting in the iron and steel industry; for causticizing, and the manufacture of bleach, paper filler, by-products from waste liquor in the paper industry; as a softening agent, corrosion corrective, and for iron, color, and objectionable gas removal in water treatment; as an important ingredient in the manufacture of soda-lime glass; for dehairing hides in the leather industry; as a raw material in the manufacture of calcium carbide and calcium cyanamide; in the processing or manufacture of sand-lime brick; silica brick; sugar; insecticides, fungicides, and disinfectants; glue and gelatin; sodium bicarbonate and soda ash; paint pigments; varnish; lubricating greases; textiles; dyestuffs and intermediates; and for the treatment of sewage and trade wastes.

LIQUEFIED PETROLEUM GASES

Principal members of the group are: ethylene, propane, butane, isobutane, propylene, butylene. Butane is used for enriching water gas; as a base material for manufactured gas; in connection with butane-air distribution from central stations where manufactured or natural gas is not available. Propane is widely used for so-called "bottle service," for country residences, etc. Butane is used for commercial heating in plants. Ethane is sometimes used as a fuel. Ethylene is used for ripening fruit and as an anaesthetic. Propylene and butylene are used in organic synthesis.

METAL HYDRIDE
SALTS
MAYWOOD CHEMICAL WORKS
Maywood, New Jersey
Manufacturers Since 1896

LITHIUM HEADQUARTERS

Three important factors give Metalloy closest possible control over the quality of our Lithium metal and salts:

1. Own ore deposits.
2. Own complete electro-metallurgical and chemical processing plant.
3. Possess adequate research facilities and personnel.

Available in commercial and experimental quantities:
LITHIUM METAL—Ingot, cups, rod, wire, shot, ribbon. Uses: Organic synthesis. LITHIUM HYDRIDE—Lump, ground. Uses: Drying agent, hydrogen generation, organic reactions. LITHIUM AMIDE—Lump, powder. Uses: Stable amide for organic condensations. LITHIUM BROMIDE, LITHIUM CARBONATE, LITHIUM CHLORIDE, LITHIUM FLUORIDE, LITHIUM HYDROXIDE—Anhydrous, monohydrate, LITHIUM NITRATE.

CERAMIC LITHIUM COMPOUNDS
LITHIUM ALUMINATE, LITHIUM COBALTITE, LITHIUM MANGANITE, LITHIUM METABORATE DIHYDRATE, LITHIUM MOLYBDATE, LITHIUM SILICATE, LITHIUM TITANATE, LITHIUM ZIRCONATE, LITHIUM ZIRCONIUM SILICATE.

METHYL ETHYL KETONE

Much lower evaporation rate than acetone, which reduces fire hazards and handling losses. Clear, colorless liquid belonging to the medium boiling solvents. Used in the manufacture of nitrocellulose cements, artificial leathers, fabric coatings, photographic film, varnish and lacquer removers, and cleaning liquids; as a solvent for dewaxing lubricating oils, vinyl resins, cellulose acetate, and synthetic rubbers.

2-NITRO-1-BUTANOL

$CH_3CH_2CH(NO_2)CH_2OH$. This compound, liquid at ordinary temperatures, can be distilled under vacuum without difficulty. Readily esterified with organic acids; the esters are stable to heat. However, the esters hydrolyze readily and, in alkaline solutions, react to yield nitrobutylene and the salt of the acid. Having the structure of a secondary nitro compound, it undergoes condensation reactions with aldehydes to form dihydroxy compounds.

NITROCELLULOSE (Pyroxylin, Gun Cotton)

$C_{12}H_{16}(ONO_2)_4O_5$. M.W. 504.16. Yellowish, amorp. mass. Sp. gr. 0.1-0.3. Sol. ether, alcohol, ethyl acetate, nitrobenzene, benzene, acetone, amyl acetate, etc. Uses—mfr. explosives, collodion solutions, lacquers, photographic films, bronzing liquids, dopes, cements, enamels. Grades—tech. Cont.—kegs, various sizes. Ship reg. prohibited by express; wet with water, inflammable solid; dry, dangerous explosive; wet with alcohol or solvent, inflammable liquid.

OILS FISH

Fish oils would include all oils expressed or extracted from various types of fish and would include cod, sperm, seal, and codliver oils, but in trade usage the term includes those oils which find special application in paint, linoleum, oil-cloth formulation, in thinning oils, soaps, etc., or combinations of fish oils used for these purposes. The most commonly used are menhaden, sardine, herring, salmon, whale, etc. See Oil, Menhaden; Oil, Sardine; Oil, Herring; Oil, Salmon; Oil, Whale.

OILS FISH (Hydrogenated)

Various fish oils treated with hydrogen in presence of catalyst to produce a stearic acid substitute. White to grayish mixture of different fats. Grade—depends upon its titer and iodine number. Uses—cosmetics, mfg high grade and metallic soaps (which are used in dusting powders), as stearic acid substitute for ex. in production of rubber tires.

OILS FISH (Kettle Bodied)

Fish oils which have been heat-treated and bodied in kettle to increase the viscosity or body of the oils. This produces a better flow, brushability, higher gloss and low acid number. Amber color; fish odor has been oxidized and resultant odor is therefore lighter. Uses—printing ink, silk screen printing, paints, enamels, mill white, patent leather, linoleum, varnishes.

OILS HYDROGENATED

Prepared by adding additional hydrogen to oils whose molecules are unsaturated as regards hydrogen. This is done in the presence of finely divided nickel as a catalyst. The process is complex and there are many variations. Hydrogenation may be stopped at any stage, and very hard fats may be mixed with untreated oils so that any degree of hardness or softness is obtainable. The principal use for hardened oils is for cooking and in the manufacture of soap. Fish oils when hydrogenated lose most of their disagreeable odor and in this form can be used in soap kettles and also are used in paint formulation.

OILS SULFONATED

Sulfonated oils are products of the action of strong sulfuric acid on vegetable, animal, and mineral oils; also their fatty acids, and alcohols. They are available at the present time for use in a wide variety of processes in the textile, leather, metal and miscellaneous industries as follows: sulfonated castor oil, olive oil, neatsfoot oil, lard oil, rape oil, mustard seed oil, tea seed oil, sunflower oil, tallow-moleic acid (red oil), cod oil, herring oil, whale oil, sperm oil, coconut oil, palm kernel oil, palm oil, degras, fatty acids of the foregoing oils, fatty alcohols, and products from mineral oil refining. All these have special physical characteristics useful for specific purposes. Sulfonated oils were originally used for the mordanting of cotton. With improvement in solubility their use has been gradually developed as softeners, as detergents, and as wetting agents. U. S Bureau of Standards in Commercial Standard CS43-32 defines sulfonated oils; the term "sulfonated oil" shall designate the product of interaction between a saponifiable oil or fat or its fatty acids, or a mixture of saponifiable oils or fats or their fatty acids, and sulfuric acid or similar sulfonating agent, the reaction to take place under such conditions that some or all of the oil is converted into a sulfate. With the exception of water and alkali, it shall contain no other admixture. A sulfonated oil of any particular designation shall contain no other oil or fat, except the kind designated.

OILS TANNING

Primary function of oils in tanning operations is the lubrication of the collagen bundles, which form the larger portion of the hide, so that they will not glue together resulting in a hard, brittle leather. Many oils and fats are used: tallow and oleo-stearine for stuffing harness, strap and belting leather; neutral oils such as cod, neatsfoot oil, castor, mineral, etc. See also Fat Liquors; Oils, Sulfonated; Tallow, Sulfonated.

PECTIN

Complex vegetable carbohydrate found in fruit juices. Being natural material, it is not uniform in strength. An arbitrary standard has been set which depends on several factors. In other words, a #100 pectin would jellify 100 lbs. of sugar combined with water or juices, so as to give a 65% sugar content in finished product having pH of 3.00.

Standardizing is accomplished by checking finished pectin and diluting with sufficient quantity anhydrous corn sugar to give strength of above standard. For export purposes, to reduce freight and space, a #160 grade is frequently sold. Newer developments of pectin are not entirely dependent on jellying strength, for this reason it appears inadvisable to dilute with sugars, the pectin being sold in as pure state as possible, with statement of jellying strength, which might be #140, #160, #185 or possibly #200. Uses—in drug trade, quenching of steel, binder for tablets, as stabilizer, and generally where active protective colloid is desired, or where controlled viscosities are required.

PIGMENTS, CHROMIUM

More common members of this group are: pure chrome green (a precipitated mixture of lead chromate and iron ferro and ferricyanide blue) reduced chrome green, also known as grinders' green (a mixture of lead chromate and iron ferro and ferricyanide blue precipitated on a base of barium sulfate or insoluble siliceous material or any mixture thereof); chrome oxide green (a practically pure sesqui-oxide of chromium, Cr_2O_3); chrome yellow (usually mixtures of normal and basic lead chromates). Finished products are sold in the dry form or ground in oil, or in japan to form a paste. See A.S.T.M. Standard Specifications D212-27; D211-27; D263-28; D211-27. See also Pigments, Green; Pigments, Yellow. See Lead Chromate, Chromium Oxide, Chrome Green.

PIGMENTS, EXTENDER

Extender pigments having a wide range of chemical and physical properties are commercially available, such as the high- and low-oil-absorption precipitated calcium carbonates, diatomaceous earth, bleached silicas, and transparent water-ground mica. These, properly formulated in paints, varnishes, and lacquers produce special effects. Diatomaceous earth can be used to flat a paint or lacquer without excess pigmentation. Low-oil-absorption calcium carbonate is added to white enamels to reduce drag and improve leveling. High-oil-absorption precipitated calcium carbonates improve the dry hiding power of inside whites, and also aid in producing a dead flat effect.

PIGMENTS, EXTENDER (cont'd)

Transparent, white, water-ground mica, if added to a lacquer film, adds mechanical strength without affecting transparency. Mica can be used in small amounts to overcome checking and cracking of outside paints. Other extender pigments include talc, barytes, clay, slate, limestone, chalk, whiting, gypsum, Terra alba.

PIGMENTS, GREEN

Most commonly employed green pigments are: 1. Chrome Green, C. P., a combination of Prussian blue and chrome yellow, different proportions of which give a variety of tints; 2. Brunswick Green (often called Grinders), a reduced chrome green precipitated on barytes with less opacity and staining power, but greater brilliancy than chrome green, C. P.; 3. Chromium Oxide, a yellowish or sage green of good opacity, unaffected by light, heat, acids or alkalies, but somewhat dull in color; 4. Guignet's Green, permanent, stable and inert, very brilliant, but more expensive.

PIGMENTS, LUMINOUS

The principal substances that absorb rays of light and emit them in the dark are the sulfides of the alkaline earths and sulfides of zinc. The former react only feebly, zinc sulfide gives fairly intense illumination. Luminous pigments are used chiefly in the formulation of luminous paints, for stage purposes, in printing, etc.

†Vogel Luminescence Corp, San Fran, Calif

PIGMENTS, MICA

In the paint pigment field wet-ground mica supplements as well as replaces asbestine or fibrous talc and is preferably used to the extent of 10% of the pigment. Specifications generally call for 90% ground through 325 mesh and smoothly rounded edges. If the edges are ragged, as are those of ordinary dry-ground mica, the particles will not lie on one another like fish scales or orient themselves in the plane parallel to the paint film surface. Bulky or granular particles likewise are not desired for the reason that equidimensional particles do not tend to force the paint film. Mica is claimed to be superior to fibrous materials, inasmuch as it not only tends to hold together the film as does the hair or fiber in plaster, but it also binds the film (due to the overlapping of plates like fish scales), increases its wearing qualities, and acts as a lubricant. The fact that mica flakes, although transparent to ordinary light, are quite opaque to ultraviolet light may contribute further to desirable properties of this new pigment extender. Another advantage is the high bulking quality (sp. gr., 3.35; wgt. per gal., 27.75; bulking, 0.0361 gal. per lb.).

PIGMENTS, PAPER

Various products used in the manufacture of paper to improve the opacity, whiteness, and brightness. Among the more common pigments employed are: titanium dioxide and composites of the dioxide with blanc fixe or calcium sulfate; the three main grades of zinc sulfate pigments, namely: 1. Commercial zinc sulfate; 2. Zinc sulfide pigment containing approximately 50% blanc fixe; 3. Zinc sulfide pigment containing approximately 70% blanc fixe. Paper pigments differ from paper fillers in that the latter usually have relatively large particle size, low whitening or opacifying power, and are retained by mechanical filtration rather than by adsorption. Many of the paper pigments are added in the beater stage, others like zinc oxide in the coating operation.

PIGMENTS, RED

Most commonly used red pigments are: 1. Red oxide, the shades vary from brown (Spanish) to deep red (Persian Gulf), more brilliant shades are produced chemically with a lighter ferric content; 2. Burnt ochre; 3. Burnt Sienna; 4. Red Lead (seldom used except as a priming coat); 5. Basic Lead Chromate; 6. Vermilion (the oldest of brilliant red pigments and prepared by subliming mercury and sulfur together); 7. Cadmium Red, a compound of cadmium, sulfur, and selenium, and largely used in artists' colors.

PIGMENTS, RUBBER

A wide variety of products used to impart colors to finished rubber articles and roughly classified as chemical or mineral pigments. Mineral pigments must withstand action of sulfur in the vulcanization operation, and usually iron oxides, zinc oxides, chromium oxides, complex sulfides of antimony, cadmium, mercury, and zinc, ultramarine blue and Prussian blues. Titanium oxides, carbon black, etc., are employed. Chemical pigments are in the form of lakes, toners, dyes, etc. Specially dispersed pigments and colors are required for latex.

PIGMENTS, TITANATED LITHOPONE

Titanated lithopones widely used to increase the opacity of either flats, enamels, or exterior paints; also as beater addition or for surface application in paper making. Their tin to medium consistency permits high pigmentation at low consistencies, or their high opacity may be used to produce high-hiding finishes at low-pigment concentration.

PIGMENTS, TITANIUM

Outstanding characteristics are great hiding power, chemical inertness, stability, ability to withstand extreme conditions of exposure without alteration or discoloration. Basic raw material is ilmenite and the principal titanium pigments are Titanium Barium Pigment, Titanium Calcium Pigment, Titanium Magnesium Pigment, and Titanium Dioxide. Titanium pigments are used in the manufacture of paint, paper, oil-cloth, linoleum, textiles, ink, rubber goods, and in many other industries where white pigments are required. **See also: Titanium Dioxide.**

PIGMENTS, WHITE

Materials which impart a white color to paints, lacquers, rubber, oil-cloth, linoleum, enamels, paper, textiles, cosmetics, leather, etc. Most common white pigments are lithopones, titanium oxides, extended titanium pigments, barytes, titanated lithopones, zinc sulfide, zinc **oxides, etc.**

PIGMENTS, YELLOW

Most commonly employed yellow pigments are: 1. Chrome Yellows, varying in color from pale yellow to dark orange. They are brilliant in tone and of considerable opacity and strength of color, and are reasonably permanent; 2. Barium Chromate, pale yellow in color, and unaffected by hydrogen sulfide; 3. Zinc Chrome, pale yellow in color, but completely decomposed by acids and alkalies, but resistant to heat; 4. Yellow Oxide, artificially prepared, stronger in color than ochre, inert, and resistant to heat; 5. Cadmium Yellow, which is a sulfide of cadmium, durable, and lightproof; 6. Yellow ochres; 7. Siennas.

PIGMENTS, ZINC

Principal members of this group are: 1. Zinc oxides, sometimes known as "Zinc White" and produced by the American process direct from the ore, or by the French process from spelter. Available in the dry form or ground in oil to form a paste; 2. The leaded zinc oxides: 3. Zinc Sulfide in either the dry pigment or ground in oil; 4. Lithopone, a combination of zinc sulfide and barium sulfate, also available in the dry or paste form. See A.S.T.M. Standard Specifications. D79-24; D80-25; D386-36; D385-36. **See also: Lithopone, Zinc Oxide, Zinc Sulfide.**

POLYSTYRENE

$(C_8H_8)X$. Softening point—various, according to degree of polymerization. Color—light yellow to water white. Solubility—soluble in aromatic hydrocarbons, chlorinated hydrocarbons and esters. Resin characteristics—thermoplastic. Molds under pressure at temperatures of 150-200°C. Very low water absorption. High dielectric value. High mechanical strength. Modifications—sometimes modified with plasticizers or fillers. Uses—molding by injection, extrusion or casting. Impregnation of electrical coils. Lamination of fabrics. Bonding of abrasive wheels. Surface finishes.

POLYVINYL ACETATE

$(CH_2CHOOCCH_3)$. Colorless, odorless, tasteless, transparent, synthetic resin. Thermoplastic. Density 1.189 (15°C.). Insol. water, gasoline, oils, fats. Sol. lower alcohols and esters, benzene, chlorinated hydrocarbons, ketones. Water-emulsion stable. Uses—in protective, wear-resistant films and coatings; as a size or stiffener for specialty paper; in heat-sealing and solvent-activated adhesives; in lacquers, paints, gravure and emulsion-type printing inks. Grades—solid resin in low, medium, and high viscosities; water emulsions and solutions in organic solvents--low and high viscosity.

KOPPERS
POLYSTYRENE

KOPPERS POLYSTYRENE 8X combines the excellent electrical and mechanical properties of regular polystyrene with increased heat distortion temperature (over 200° F.), greater tensile and flexural strength, fast, easy moldability.

KOPPERS POLYSTYRENE 7X has a minimum heat distortion temperature of 190°F. Its tensile and flexural strength are also higher than general purpose polystyrene.

KOPPERS POLYSTYRENE 3X offers you the low cost and fine molding qualities that make it desirable for mass production items.

KOPPERS POLYSTYRENE 81, 71 and 31 are the externally lubricated forms of the products listed above. Where mold release and ease of flow are of critical importance, these types are suggested.

ALL KOPPERS POLYSTYRENES are available in a wide variety of transparent, translucent and opaque colors.

POTASSIUM CYANATE

KCNO. M.W. 81.11. A white crystalline solid, specific gravity 2.05. Readily soluble in water and anhydrous ammonia, insoluble in absolute alcohol. Melts at dull red heat without decomposition. Principal consumption of Potassium Cyanate is in the manufacture of organic chemicals and drugs. Hypnotics, narcotics and similar drugs are made from this product. Typical products are known chemically as substituted ureas, urethanes or hydantoins.

PROTEINS, SOYA BEAN

Proteins derived from the Soya Bean are now available commercially in isolated and non-isolated form. These proteins resemble very closely the characteristics of animal proteins derived from milk and in addition possess many outstanding characteristics of their own. They are widely used in the manufacture of adhesives and are increasingly used for a variety of other applications such as the manufacture of paint, paper sizing and coatings as dispersing and deflocculating agents and as textile sizes.

PROTEINS, VEGETABLE

Most of the grains and cereal crops contain protein and a number of industrial and edible applications have been developed. The chemical physical and behavior characteristics of these proteins differ so that a general comment is not possible. See also Soya Bean Proteins.

QUINALDINE

$C_{10}H_9N$. M.W. 143.18. Spec. gr. 1.056 at 25°/4°C. Ref. index 1.6072 at 25°C. B.P. 247.0°C. (760 mm.). M.P. -2.0°C. Sol. in water 0.7% at 25°C. Basicity, ml. N HCl/Gm., 6.99. Odor, sharp, quinoline-like. Color, water-white, discolors on standing. Chemical properties: quinaldine resembles quinoline in chemical properties except for the reactivity of the methyl group which enters into condensation reactions or halogen substitution. Uses—in the preparation of dyes, pharmaceuticals, and fine organic chemicals.

REFRIGERANTS

Various gases which circulated in the coils of refrigerating, ice-making, and air-conditioning machinery, compressed or liquefied under pressure, and then allowed to expand, absorb heat from the surrounding medium. More commonly used refrigerants are: ammonia, carbon dioxide, sulfur dioxide, methyl chloride, certain hydrocarbons such as butane, isobutane, propane and ethane, dichlorodifluoromethane, trichloromonofluoromethane, and dichlorotetrafluoroethane, etc. See also Gases Refrigerating.

RESINS, ACRYLIC

Synthetic plastics produced from acrylic acid esters with outstanding characteristics of colorless transparency, excellent adhesion to most surfaces, chemical resistance, and great elasticity and in physical appearance range from soft, sticky semi-liquids to hard thermoplastic solids. Solutions of acrylic resins are used for coatings, adhesives, electrical insulation, impregnation, and for the manufacture of laminated glass.

Retentivity in Cellulose Acetate	Over 100	Over 100
Acid Number	Neutral	Neutral

Santolite MS—80% Solution—Supplied at 80% solids in solution with 20% normal Butyl Acetate also as 100% solids.

*Retentivity is given in parts per 100 parts by weight of the Cellulose Nitrate or Cellulose Acetate.

GENERAL INFORMATION

Santolite MHP: An aryl sulfonamide-formaldehyde resin well adapted to specialty lacquers, including manicure lacquer, fabric coatings, molding compositions, etc Exceptional features are ease with which it can be worked into practically every formula using a cellulose ester and wide variation of properties obtained by its use. High degree of solubility makes very concentrated solutions possible; extreme compatibility with plasticizers and cellulose esters removes much of danger of blushing, sweating, separation. Can be used in spraying, dipping or brushing lacquers to make clear, colorless, odorless coatings of good gloss and adhesion. Does not materially increase viscosity, permits building up high solids content in lacquer.

Santolite MS—80% Solution (in Butyl Acetate). Like all Santolites, MS is compatible with both nitro-cellulose and cellulose acetate. Being solvent for both, can be used in any proportion. Forms brittle compositions with both, but addition of plasticizer makes combinations permanently flexible. Excellent for water-white lacquers not exposed to extreme weather conditions, its high gloss, lack of color being unusual in the resin field. Santolite MS is also worthy of consideration in manicure lacquer.

AROMATIC TAR

High-boiling, unsaturated, aromatic-type hydrocarbon polymer. Important advantage is economy, especially where color is relatively unimportant. Used in low-cost paints and varnishes, bituminous paints, printing inks, core oils, saturating asphalts, flotation oils, soil sterilizers, wood preservatives, manufacture of carbon black.

CTLA POLYMER

Heat-reactive, aromatic-type olefinic hydrocarbon liquid polymer. Highly unsaturated. Dries by oxidation and polymerization. Low cost. Advantageous as resin or drying oil extender in paints, varnishes, printing inks, core oils, roofing compounds, floor coverings.

RESINS, COAL-TAR

Synthetics produced usually from crude coal-tar naphthas in the approximate boiling range of 150-200° C. The paracoumarone-paraindene resins are thermoplastic, range from a very faint yellow to darker shades; sold in flakes, chips, or liquid form. Coal-tar resins possess good resistance to alkalies and acids; used as a binder in floor tile, in rubber compounding, in varnish formulation, in adhesives, rubber cements, mixed with other synthetic resins for special purposes.

RESINS, POLYSTYRENE

Styrene is a colorless liquid boiling at 146° C. and having a density of 0.925. Ethyl benzene is the raw material. Is readily converted into solid polystyrene by heating with or without catalysts. Physical properties can be made to vary widely by the conditions under which polymerization is conducted. Widely used in electrical work because of its dielectric properties, is a true thermoplastic, used also as a hardening and adhesive promoting agent for waxes used as a base for low varnishes and lacquers. Highly resistant to water, alcohol, most acids and bases. Softening point of approx. 90° C. Density 1.054. Readily molded at temperatures between 145 and 160° C.

RESINS, RUBBER

Substances derived from rubber used as base in the manufacture of coating materials and finishes; possess good resistance to acids, alkalies, and corrosive chemicals; effectively withstand moisture penetration, salt water spray, have good electrical properties, insoluble in most solvents, tasteless, odorless, and non-toxic, and with excellent adhesive and bonding properties.

RESINS, VINYL

Thermoplastic resins made by the polymerization of vinyl acetate, vinyl chloride, and combinations of the two, possessing the characteristics of being tasteless, odorless, non-flammable, and with the exception of the polyvinyl acetate group not acted upon by acids, alkalies, alcohol, water, oil, greases, etc. Vinyl resins find wide application in lining metal containers, for caps, coating cement coatings, molding phonograph records, dentures, impregnating fabrics, coating papers, and for molding miscellaneous items. Available in sheets, rods, tubes, and powder for molding.

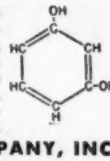
RESORCINOL (Resorcin, Metadihydroxybenzene, Benzenediol)



$C_6H_4(OH)_2$. M.W. 110.05. Almost colorless cryst. Sp. gr. 1.285 (15°C.). M.P. 110°C. B.P. 276°C. Sol. water, alcohol, benzene, amyl alcohol. Uses—mfr. phthalein and azo dyestuffs, fluorescein colors, pharmaceuticals, trinitroresorcinol, eosin, hair remedies; camphor substitute in celluloid; laboratory reagent; textile dyeing and printing; in medicine. Grades—U.S.P.; powd.; commercial; crude; resublimed.

Koppers Resorcinol

(meta-dihydroxybenzene)

Grades Available: Technical and U.S.P.

USES: In the preparation of low-pressure, room-temperature setting resorcinol-formaldehyde resin-adhesives; to modify phenol-formaldehyde, urea-formaldehyde, casein-formaldehyde and analogous resins; as a chemical intermediate for dyestuffs, medicinals, textile and leather chemicals, rubber tackifiers, and explosives.

SAND, GLASS-MAKER'S

Sand of exceptionally high degree of purity and particle size, with low iron content present either as fine metallic rubbings from grinding and handling, as the rusty particles resulting from exposure of these iron rubbings, as any mineral iron (hematite, magnetite, limonite, ilmenite), or as silicate minerals in which iron is present as a constituent (garnet or mica). Specifications emphasize particularly total iron content, expressed for convenience and accuracy in terms of Fe_2O_3. Other impurities are important, in general, only because their presence reduces the available quantity of silica itself. Permissible iron content depends upon the character or rather the "color," of the glass to be produced. Sand generally is defined in A.S.T.M. C58-28 as "The fine granular material (usually less than ¼ in. in diameter) resulting from the natural disintegration of rock, or from the crushing of friable sandstone rocks." See also Silica.

DAVISON SILICA GEL

SILICA GEL

DESICCANT, CATALYST, CARRIER OF CATALYSTS

Hard, granular, clear, colorless colloidal material, capable of adsorbing large quantities of liquids or condensable gases; one cubic inch contains pores having a surface of about 50,000 sq. feet. Non-deliquescent. Will not cake nor powder. Can be reactivated at low temperature. Available in 3-mesh to minus 325 mesh.

Uses: Desiccant; as a catalyst and carrier of catalytic agents in many organic and inorganic processes; anti-caking agent; drying of gases, liquids and solids; air conditioning; industrial applications such as drying telephone cable splices and drying refrigerants; process drying, etc.; for Dehydrated Packaging.

Moisture-Indicating Type (TEL-TALE* silica gel) changes color as saturation point is approached.

HYDROGEL—colloidal silica compound—chemically active with alkalies—which can be mulled.

PROTEK-SORB* silica gel—the protective adsorbent for dehydrated packaging.

Davison's is the original Silica Gel . . . developed to its present high-adsorbent qualities by Davison Research. Our chemical engineers can assist you to overcome your dehydrating and dehumidifying or catalyst problems. Informative literature is available.

Silver Nitrate Merck

C.P. CRYSTALS

Every ounce of Silver Nitrate Merck is the cumulative result of more than one hundred years of manufacturing experience . . . years of deliberate striving toward an objective—the creation of America's Finest Silver Nitrate. Specifically, the factors which make Silver Nitrate Merck best suited for even the most exacting use are:

(1) The process is housed in special surroundings to ensure maximum freedom from floating dust particles. (2) The product undergoes 26 separately conducted tests—ten are on raw and auxiliary materials; five cover intermediate stages of manufacture; eleven are on the finished material. (3) Special drying apparatus is used to remove moisture.

SODIUM ACETATE

ANHYDROUS

PURE, CLEAN, UNIFORM, DEPENDABLE

The production of NIACET Sodium Acetate is carefully controlled to insure a high quality product suitable for particular jobs such as tanning, electroplating, and photography, where purity is essential.

3 lb. Anhydrous = 5 lb. 60% Grade

Anhydrous grade is recommended as the best value and the most efficient to use, store and ship.

WHAT MAKES

Sodium Benzoate Merck

A DISTINCTIVE PRODUCT?

Perhaps you can't see how there could be a *big difference* between Sodium Benzoate Merck and other brands—but there is . . .

1. Sodium Benzoate Merck is clearly soluble and odorless.
2. Sodium Benzoate Merck is as tasteless as manufacturing skill on a commercial scale can possibly make it.
3. Sodium Benzoate Merck is manufactured by a highly perfected process which ensures the highest quality possible.

GLYCEROPHOSPHATES

Calcium Glycerophosphate, N.F.

Specifications: Fine white powder; assay (dry basis) 98.0% min.; loss on drying at 130° C., 12.0% max.; solubility in water (1:50), complete at 25° C.; chlorides (as $CaCl_2$), 0.1% max.; sulfates (as $CaSO_4$), 0.68% max.; free phosphates (as P_2O_5) 0.02% max.; conforms to N. F. test for heavy metals; 3.0% max. retained on 80-mesh; 5.0% max. on 100-mesh.

Ferric Glycerophosphate, N.F.

Specifications: Buff or yellowish green powder; assay (dry basis), 17.0% Fe min.; moisture 11.0% max.; chlorides (as $FeCl_3$), 0.1% max.; sulfates (as $Fe_2(SO_4)_3$), 0.2% max.; free phosphates (as P_2O_5), 0.2% max.; 2.0% max. retained on 60-mesh, 10.0% max. on 140-mesh, 30.0% max. on 230-mesh.

Magnesium Glycerophosphate

Specifications: White powder; assay (dry basis), 97.0% min.; moisture, 12.5% max.; calcium (as $CaCl_2$), 0.3% max.; chlorides (as $MgCl_2$), 0.1% max.; sulfates (as $MgSO_4$), 0.1% max.; free phosphates (as P_2O_5), 0.2% max.; heavy metals, 30 ppm max.; 2.0% max. retained on 60-mesh, 4.0% max. on 80-mesh, 10.0% max. on 100-mesh.

Manganese Glycerophosphate, N.F.

Specifications: Pinkish white powder; assay (dry basis), 98.0% min.; solubility in 25% citric acid solution (1:5), complete; moisture, 11.0% max.; chlorides (as $MnCl_2$), 0.15% max.; sulfates (as $MnSO_4$), 0.25% max.; free phosphates (as P_2O_5), 0.20% max.; conforms to N. F. test for heavy metals; 2.0% max. retained on 60-mesh, 4.0% max. on 80-mesh, 10.0% max. on 140-mesh.

Potassium Glycerophosphate (75% Solution)

Specifications: Clear, colorless or slightly yellowish solution; assay, 61.6-63.2% anhydrous salt; carbonates (as K_2CO_3), 0.5% max.; chlorides (as KCl), 0.1% max.; sulfates (as K_2SO_4); 0.1% max.; free phosphates (as P_2O_5), 0.2% max.; heavy metals, 20 ppm max.

Sodium Glycerophosphate

Specifications, N. F.: White crystals or powder; assay, 68.0-72.0% anhydrous salt (equivalent to 96.4-104.9% hydrated salt); solubility in water (1:10), complete; chlorides (as NaCl), 0.05% max.; free phosphates (as P_2O_5), 0.02% max.; conforms to N. F. test for heavy metals; sulfates (as Na_2SO_4); 0.1% max.

Specifications, 75% Solution: Clear, colorless or slightly yellow solution; assay 50.0-52.0% anhydrous salt; carbonates (as Na_2CO_3) 0.5% max.; chlorides (as NaCl) 0.1% max.; sulfates (as Na_2SO_4) 0.2% max.; free phosphates (as P_2O_5) 0.15% max.; heavy metals, 20 ppm max.

Glycerophosphoric Acid (35% Solution)

Specifications: Clear, colorless liquid, APHA 30 max.; assay, 35.0-36.0%; chlorides (as CaCl) 0.15% max.; sulfates (as $CaSO_4$), 0.30% max.; calcium (as CaO), 0.35% max.; free phosphates (as P_2O_5), 0.50% max.; heavy metals, 40 ppm max.

"VIRGINIA"
SODIUM HYDRO
DOES IT!

"Virginia" Sodium Hydrosulphite is used for vat color reduction, textile decolorizing and stripping, and in the bleaching of soaps, sugar, oils, and minerals, as well as straw and other fibres. It is a concentrated, free-flowing, uniformly crystalline white powder combining unusual product-stability with high reducing efficiency in solution. In 250-lb. single-trip steel drums.

SODIUM METHYLATE

CH_3ONa. M. W. 54.031. Sodium Methylate is an amorphous, white, free flowing powder easily soluble in methyl and ethyl alcohol. It reacts with the moisture in air to form caustic soda and methyl alcohol. It is sensitive to the oxygen in air. It decomposes on heating to about 300° with the formation of ethylene, Na_2CO_3, C and H. When heated in the presence of air to 100-150°C. alcohol is split off and a mixture of sodium carbonate, formate and acetate is formed. At 200°C. oxalate is also obtained. Uses—in various condensation reactions such as in the preparation of aceto acetic ester and barbiturates; in the condensation of alkyl carbonates with organic esters and ketones and in pyrimidine condensations.

Specifications: White crystalline powder; assay, 98.0% min.; solubility in water (1:5), complete, colorless; solubility in ethyl alcohol 95% (1:5), complete; conforms to N. F. test for heavy metals. No powder retained on 80-mesh screen.

Calcium Salicylate

Specifications: Fine white powder; solubility in water (1:50), complete, colorless; free salicylic acid, 0.25% max.

Lithium Salicylate, N. F.

Specifications: White or slightly grayish powder; assay 98.5% min.; solubility in water (1:20), complete, colorless; conforms to N.F. test for heavy metals.

Magnesium Salicylate

Specifications: Fine white powder; solubility in water (1:10), complete.

Methyl Salicylate, U. S. P.

Specifications: Clear, colorless liquid; assay 98.0% min.; solubility in 70% ethyl alcohol (1:7), complete; solubility in N KOH (1:10), complete; sp.g. 25°/25° C., 1.180-1.185; conforms to U.S.P. test for heavy metals.

Phenyl Salicylate, N. F. (Salol)

Specifications: White crystals; solubility in ethyl alcohol 95% (1:6), complete; m.p. 41.0° C. min.; conforms to N.F. tests for chloride, sulfate, free phenol, and free salicylic acid.

Potassium Salicylate

Specifications: White or very slightly pinkish powder, assay (dry basis), 99.0% min.; solubility in water (1:10), complete.

Sodium Salicylate, U. S. P.

Specifications: White powder or crystals; assay (as received) 99.5% min.; solubility in water (1:10), complete; solubility in ethyl alcohol 95% (1:10), complete; colorless or nearly colorless; conforms to U.S.P. tests for heavy metals and carbonizable impurities; trace max. powder retained on 60-mesh, 1.0% on 80-mesh, 2.0% on 100-mesh.

Strontium Salicylate, N. F.

Specifications: White crystalline powder; assay (as dihydrate), 99.0% min.; solution in water (1:30), complete; conforms to N.F. test for heavy metals and barium.

Salicylic Acid (Ortho-Hydroxybenzoic Acid)

Specifications of U.S.P. Grade: White needles or powder, 100-mesh; assay 99.5% min.; m.p. 158.0° C. min.; conforms to U.S.P. test for carbonizable substances; ash 0.05% max.; powder, 0.4% max. retained on 100-mesh.

Specifications of "B" Grade: White needles; assay 99.5% min.; m.p. 158.0° C. min.

SODIUM SULFADIAZINE (Sodium 2-Sulfanilamidopyrimidine)

M.W. 272.27. White crystalline powder, very soluble in water, soluble in alcohol; pH of 10% solution, 9.3 to 9.8. May be assayed by diazotization. Aqueous solution absorbs carbon dioxide from air with precipitation of sulfadiazine. Uses—same as sulfadiazine. In jected intravenously to give immediate high blood levels of the drug in emergency cases.

SODIUM SULFATE (Salt Cake)

Intermediate product in manufacture of sodium sulfate, containing Na_2SO_3 (principally), $NaHSO_3$, $CaSO_4$, $Fe_2(SO_4)_3$, $MgSO_4$, SiO_2 and NaCl. As anhydrous sodium sulfate Na_2SO_4. White, solid crystalline. Sp. gr. 2.671 (20°C.). M.P. 884°C. Sol. water. Uses—mfr. water glass, plate and window glass, sodium salts, ceramic glazes, ultramarine, paper pulp, soap, freezing mixtures, detergent compositions; diluting dyestuffs. Grades—glassmakers' (free from iron); tech.

NAXONATE . . . *A Wyandotte Hydrotrope*

Sodium Xylenesulfonate, marketed under the name of Wyandotte Naxonate, has the unusual property of increasing the solubility of a great variety of organic chemicals in water. Naxonate is useful for attaining and maintaining the homogeneity of scouring and sizing compositions, printing pastes and spotting agents. It is finding application in solvent extractions and in speeding up chemical reactions in aqueous solutions.

SOLVENTS COAL-TAR

Coal-tar solvents are generally aromatic hydrocarbons of the benzene series, but other compounds obtained from coal tar, as those of the phenol series and nitrogen bases, such as pyridine, have special solvent properties that make them useful for a wide variety of purposes. Ordinarily the constituent compounds are those contained in coal-tar light oil obtained both from scrubbing coal gas or by the distillation of coal tar produced by the high temperature carbonization of bituminous coal. They are supplied to meet required specifications as to boiling range color, flash point, etc. See alsoNaphthas, Benzol, Toluol, Xylol, etc.

SOLVENTS DYE—see Chemical Specialties Section

SOLVENTS ETHYL CELLULOSE

Ethylcellulose films of maximum tensile strength and elongation are obtained from alcohol-hydrocarbon solvents formulated in such a way that the last solvent to evaporate from the film consists almost entirely of hydrocarbon. If the evaporation rates of the alcohol and of the hydrocarbon are approximately equal, the solvent mixture producing the lowest viscosity also produces the best films. The hydrocarbons that can be used alone with alcohols are aromatic hydrocarbons, hydrogenated naphthas, or high solvency naphthas. Naphthas from paraffin crudes give the best results when used with a small proportion of aromatic hydrocarbon. Solvents consisting of hydrocarbons and aliphatic ketones or esters have higher viscosities than those produced by the use of alcohols, but large amounts of ketones or esters can be used without lowering the film properties. Kauppi and Bass, Industrial & Engineering Chemistry, Vol. 30, No. 1, p. 74.

SORBIDE (Dianhydro Sorbitol)

$C_6H_8O_2(OH)_2$. A non-toxic dihydric alcohol cyclic inner ether. Pure crystals melt at 62°C. B.P. 176.5°C. at 10 mm. Commercial grade is an 83% aqueous solution of pH=5, viscosity 150-180 cp. at 25°C. Hygroscopic. Sol. water lower alcohols, ethylene glycol, cellosolve, pyridine; insol. most other solvents. Uses—conditioning agent of low viscosity and narrow humectant range; in medicine; derivative mfg. Grades—com'l soln.

†Atlas Powder Co, 9 & Market Sts, Wilmington, Del — Wilmington 6-8241

SORBITAN (Monoanhydro Sorbitol)

$C_6H_8O(OH)_4$. A non-toxic tetrahydric alcohol cyclic inner ether. Crystals are white, odorless, sweet with bitter after-taste. M.P. 110 111°C. Com'l grade is an 88% aqueous solution of pH=5, viscosity 500-900 cp. at 25°C. Sol. water, lower alcohols, ethylene glycol cellosolve and pyridine; insol. most other solvents. Uses—conditioning agent of lower viscosity and greater solubility than sorbitol, but with same narrow humectant range. Grades—crystals; com'l.

STODDARD SOLVENT

Colorless refined petroleum product specially fractionated for the dry cleaning industry. Specifications are outlined in the Bureau of Standards, booklet CS3-28. Flash Point shall not be lower than 100°F.; odor, sweet; shall show not more than extremely slight discoloration when clean copper strip is submerged in the solvent for three hours at 212°F. Distillation range, not less than 50% shall be recovered in the receiver when the thermometer reads 350°F. The dry or end point shall be not higher than 410°F. No tolerance shall be allowed above 410°F. See Benzine.

SULFADIAZINE (2-Sulfanilamidopyridine)

M.W. 250.27. White elongated prisms or crystalline powder. Sulfadiazine is soluble 0.0123 g. in 100 cc. water at 37°C. It is readily soluble in aqueous bases or mineral acids; sparingly soluble in alcohol or acetone, insoluble in ether or chloroform. M.P. between 253°-256°C. with decomposition when inserted in a bath at 245°C. and heated at 4°C. per minute. It may be assayed by diazotization. Is useful in all the diseases treated by previous sulfanilamide derivatives, especially diseases caused by β-hemolytic streptococci, staphylococci, pneumococci, meningococci, gnococci and B. coli. It has the advantage of much lower toxicity than other drugs of comparable potency, hence may be used at more effective blood levels. Its solution in triethanolamine has shown outstanding properties in treatment of severe burns.

SULFAGUANIDINE (Sulfanilylguanidine)

M.W. 232.26. White, odorless needle-like crystals or crystalline powder. Sulfaguanidine is soluble, 10 g. in 100 cc. of boiling water, and 0.22 g. in 100 cc. at 37.5°C. It is 5% soluble in boiling 95% alcohol, 1.5% in boiling acetone. It is difficultly soluble in ethyl acetate and insoluble in benzene, ether and chloroform. It is readily soluble in cold bases. It is destroyed by boiling with strong bases. It melts in the range 189° to 192°C. after preliminary softening. In a short sealed tube, it melts at 142.5°-143.5°C. It may be assayed by diazotization. Effective in treatment of various bacterial diseases of intestines such as dysentery. Is poorly absorbed into blood stream so may be given in high dosage to secure action on intestinal organisms without reaching toxic blood levels.

THINNERS, PAINT, VARNISH, LACQUER

Volatile liquids whose principal use is to reduce paint, varnish or lacquer to the desired consistency for brushing or spraying, which evaporate when the film is applied to a surface. Additional factors are: solvent action, dispersive effect, rate of evaporation, effect of storage, residue after evaporation, wetting action, odor, toxic effect, effect on brushing and leveling, effect on viscosity, etc.

triethyl phosphate

• Eastman triethyl phosphate is soluble in water and most organic solvents. Although moderately resistant to hydrolysis, it is a promising ethylating reagent. It is used as an intermediate in the preparation of the insecticide tetraethyl pyrophosphate, as an ingredient in sizing compounds, as a dyeing assistant in the textile industry, as a lubricant, and as a flame-resistant plasticizer. Available in 5-gallon cans, drums, and tank cars.

TRIETHYL PHOSPHATE

$(C_2H_5)_3PO_4$. M.W. 182.14. Colorless liq. with mild odor. Sol. in most organic solvents, completely miscible in water, very stable at ordinary temperatures. When mixed with water is quite stable at ordinary temperatures, but at elevated temperatures it hydrolyzes slowly. Purity, not less than 97% ester by weight. Sp. gr., 1.068 to 1.072 at 20°C./20°C. Acidity, not more than 0.02% calculated as phosphoric acid, and using phenolphthalein as the indicator; not more

TRIETHYL PHOSPHATE (cont'd)

than 0.229 mg.KOH required for neutralising 1 gram. Water, no turbidity when one vol. is mixed with 19 volumes of 60° Be. gasoline at 20°C. Distillation range: 190°C.-220°C., not more than 5% distilling below 210°C. B.P., 216°C. Refract. Index, 1.4065 at 20°C. Weight per gal., 8.90 lbs. at 68°F. Uses—solvent for cellulose nitrate and cellulose acetate; compatible with many gums and resins. A super high-boiling solvent and plasticiser in the manufacture of plastics and coating compositions. Very difficultly flammable and contributes in formulation of flame-proofing compounds.

VITAMIN B_2

$C_{17}H_{20}N_4O_6$. M.W. 376.36. Orange-yellow, crystalline product, melting at 280-290°C. (with decomposition). It is only slightly soluble in water (0.0025 gram in 100 ccs.), the solution exhibiting an intense yellow-green fluorescence. Readily soluble in caustic soda solution, alcohol, cyclohexanol, and amyl acetate. Insoluble in ether, chloroform, acetone, and benzol. The pure crystalline vitamin is sensitive to light, but it is stable in the dark even at high temperatures. It is also stable toward most oxidizing agents but can be reversibly reduced. A deficiency of this vitamin has an effect on growth and leads to skin lesions of various types. Riboflavin is generally used medicinally but is an essential ingredient of the new enriched flour.

WAX PETROLEUM

Obtained as by-product from the distillation of paraffin base petroleum. Outstanding characteristic is the resistance to the passage of moisture vapor. Used in candle-making, as impregnating and coating material for paper and cardboard. Low fire hazard, stability and high glosses which are obtainable with their use are certain other important characteristics. Various grades include scale wax, semi-refined wax, fully refined wax, the plastic or amorphous waxes, such as ceresine, ozokerite, etc., which while not made from petroleum in the usual sense, nevertheless are hydrocarbon waxes of mineral origin and hence can be placed in the same category as the petroleum waxes. The petrolatums are also amorphous waxes and should be included in this general grouping.

WAXES INSECT

Natural refined waxes prepared from the secretion of various insects; most important of the group are: Beeswax, lac wax, Chinese insect wax, ant wax, spermaceti. The latter is obtained from the head of the sperm whale and has particularly good waterproofing properties. See specific waxes.

WAXES MINERAL

Waxes largely derived from: 1. The distillation of petroleum oils; 2. Through solvent extraction of lignite shales; and 3. From mines. Most important members of the group are montan, paraffin, ozokerite, ceresine.

WAXES VEGETABLE

General term denoting natural waxes of vegetable origin: **See Wax Carnauba; Wax Candelilla; Wax Japan; Wax Bayberry.** Other waxes in this group include—Fibre Wax, Cotton Wax, Flax Wax, Sugar Cane Wax, Tea Wax, Rose Wax, etc. Vegetable waxes are very complex chemically and therefore difficult to define their properties. In the group are usually the hardest waxes. Carnauba is extremely hard, insoluble in water, but can be obtained in an aqueous state by boiling with alkalies and emulsifying agents. Widely used in polishes of many various types. Candelilla is very hard but somewhat brittle. Japan more closely resembles the animal tallows in composition and finds wide usage in laundry finishing, leather dressing, etc. Bayberry closely resembles Japan in its composition.

How to cover the Chemical Industries ...

COMPLETELY – EFFECTIVELY – ECONOMICALLY

IT'S A BIG MARKET

The chemical process industries are basic, still-growing and *stable*. They buy:

Raw Materials	$7,242,000,000
Maintenance Materials	281,000,000
Fuel and Power	498,000,000
Containers	305,000,000
Transportation	350,000,000
Supplies and Services	159,000,000

COVERAGE THAT COUNTS

In the process industries, 1,843 plants produce more than $1 million worth of materials annually; 2,978 plants fall into the $500,000 category.

CI will take your sales message into 3,552 plants estimated to represent 76 per cent of the industries' total purchasing power.

Here's a breakdown of calculated coverage industry-by-industry:

Textile Processing	61 %
Pulp and Paper	34
Paints, Varnish, Colors	74
Animal and Vegetable Oils	37
Drugs, Medicines, Toilet Preparations, Insecticides	81
Soap and Glycerine	96
Rayon and Allied Products	97
Hardwood Distillation, Naval Stores	45
Fertilizers	31
Industrial Chemicals	96
Miscellaneous Chemical Products	97
Petroleum Refining	81
Rubber Processing	98
Leather Tanning	23
Cement, Lime, Refractories	26
Non-Ferrous Metallurgy	93

CONCENTRATED BUYING AUDIENCE

CI's highly selective (ABC) circulation is aimed not at the mass but at the market. A certified survey has established that each copy of CI has an average of 2.77 readers (active audience: 29,400) and that 73.2% of these readers buy, specify or recommend the purchase of chemicals, equipment, containers, raw materials.

EDITORIAL SCOPE

CI is edited for the active, responsible leaders of the chemical industries. It is designed, specifically, to provide these men—the industries' planners and doers—with the essential information they must have in concise, readable, understandable form.

Editorially, CI is not concerned with the abstruse and the highly theoretical; it does stress what new technical developments mean *economically*, their overall significance and import, how they will affect markets, processing techniques, packaging procedures, etc. CI is practical, useful, usable.

How well do CI's industrially-experienced editors do their job of weighing, appraising, interpreting, integrating, featuring? Here's one criterion: This year CI won Industrial Marketing's highest award for outstanding editorial achievement.

CI commands the reader interest of the important people you want to reach.

It forms a potent, productive vehicle for your sales message.

LOW, COST CONTINUITY

Want to sharpen your pencil and figure how you can talk to this husky, stable industry *often enough* and *regularly enough* to get your share of the $8.8 billion it spends annually? Here's how:

You can get in touch and keep in touch with CI's purchase-potent readers on a very modest budget. Twelve full pages in black and white—keeping the industry reminded *every month of the year* of you and your products costs only $2,100. Economical, effective continuity. Real coverage.

It *costs less* to be represented in CI every issue than in any other monthly or weekly publication in the field.

Let's talk about your problem, your opportunity, what we can do for you. Write, phone or wire.

FREE:

Is your company listed as a source of supply in this edition of CI's BUYERS GUIDE — the industry's most complete and widely used reference and buying directory? Whether you advertise or not you are entitled to ten FREE listings under the product classifications you select.

Drop us a line and we'll make sure you are represented in our next edition. No obligation, of course.

XANTHONE (Benzophenone Oxide)

$CO:(C_6H_4)_2O$. M.W. 196.19. White Crystalline solid. M.P. 174°C.; sublimes readily at its melting point. B.P. 355°C. Insoluble in water, slightly soluble in cold ethyl alcohol and acetone, very sparingly soluble in other common organic solvents in the cold; quite readily soluble in hot ethers and ether esters. It is a highly effective larvacide, particularly in the control of codling moth and fruit moth larvae. Other uses are as an intermediate in organic synthetics in dyestuffs, perfumes, pharmaceuticals, etc.

†Edcan Labs, 10-20 Pine St, S Norwalk, Conn — Norwalk 6-9005

o-XYLENE

$(CH_3)_2C_6H_4$. M.W. 116. Purity: 70%, 80% and higher. Colorless liquid, water-insoluble but soluble in most organic solvents. Used for vitamin and pharmaceutical syntheses.

"VIRGINIA" ZINC HYDRO DOES IT!

"Virginia" Zinc Hydrosulphite is a powerful reducing and bleaching agent prepared expressly by "Virginia" as a brightening and decolorizing agent for the pulp and paper industry. Paper products can be upgraded by as much as seven points in brightness by using this quality ZnS_2O_4—the *only* high test zinc hydro available commercially. In 250-lb. single-trip steel drums.

"VIRGINIA"
ZINC SULFATE
DOES IT!

"Virginia" Zinc Sulfate (Monohydrate) is a fine, crystalline, stable, free-flowing and non-caking product readily soluble in water. This Monohydrate has preferred properties for chemical manufacturing, rayon processing, and glue preservation. "Virginia" Zinc Sulfate is available for immediate delivery in 60- and 100-pound moisture-proof bags and 400-pound barrels.

RESEARCH CHEMICALS SECTION

This section consists of an alphabetical list of industrial research chemicals, both organic and inorganic, together with their manufacturers. It is limited to chemicals that are currently being produced in research quantities only.

Alphabetization is on the basis of the first letter of the chemical name, without regard to positional prefixes and breaks between terms. Separate categories are not provided for the various chemical families such as acids, alcohols, ethers, etc. Compounds belonging to these groups are listed according to the regular alphabetical sequence of letters in their names. For example, "Phenoxyacetic Acid" is listed under "P", and not under "A".

Key numbers after each chemical indicate the manufacturers of that chemical. At the end of this section is a list of names and addresses of companies corresponding to the key numbers.

NOTE: Chemical Industries has compiled the best information obtainable from manufacturers concerning their products. However, no responsibility can be accepted for these claims.

4-Chloro-3-nitrobenzotrifluoride 16

pure organic chemicals

Over 2500 organic chemicals stocked for immediate delivery. All the building blocks needed by the chemist, whether in research, industrial or university laboratory.

The purity of each one is guaranteed to meet our specifications.

it's too late

for this edition. But, if you sell to the chemical process industries, you can be represented in our upcoming revision.

We can list your company under the products you sell.

It will help us make the Buyers Guide even more complete. And it will help the thousands of buyers who use the Guide in the U. S. and 58 foreign countries to route their inquiries, place their orders.

What to do? Just drop us a line and tell us about your main products.

Users of Specialty Monomers

A SINGLE FOCAL POINT FOR YOUR NEEDS

Here's the service you have been waiting for — a company to act as a *single source of supply* for specialty monomers to be used for research and industry.

Glacial acrylic acid	2-Ethoxyethyl methacrylate
Glacial methacrylic acid	2-Ethoxyethyl acrylate
Diallyl maleate	Tetrahydrofurfuryl methacrylate
Diallyl oxalate	Vinyl benzoate
Diallyl succinate	Vinyl methacrylate
Diallyl fumarate	N-Vinyl phthalimide
Diallyl adipate	Allyl methacrylate
Cyclohexyl methacrylate	Ethylene glycol dimethacrylate

The above monomers are available in experimental quantities. Other monomers can be synthesized on request.

Chemical Industries

Sound, down-to-earth information for chemical men!

No abstruse, long-winded, theoretical treatises to wade through in Chemical Industries—but pithy, practical, dollars-and-cents material to help technical and business men in the chemical process industries do a better job—Yes, there's gold in CI's columns for YOU and every other chemist, chemical engineer, plant manager, research director and busy executive!

Regular monthly departments and special features

Newsletter—news before it's news, tells who's going to do what and why.
What's New—brief, interpretive discussions of new developments—highlights background, potentialities, immediate and future effect on business.
Special Features—specific phases of the various branches of the chemical process industries authoritatively presented by top men in each field—subjects chosen for timeliness and importance.
New Products and Processes—descriptive sketches—characteristics, uses, source—Technical Data Service in conjunction with this department—handy key system to obtain all available information on particular product or process.
New Equipment—has its own special department—dittos in style New Products and Processes Department.
Patents and Trademarks—digest of current chemical patents classified by industry—a real time-saver.
News of the Month—Chemical News in Pictures, General News, Canadian News, *Chemical Specialties News*, Chemical Markets, Chemical Economics & Statistics, Current Prices.
Packaging and Shipping—new designs, methods, materials—government regulations.
Booklets & Catalogs—lists available free chemical and equipment booklets—convenient coupon system to send for them.
Laboratory Notebook **Industry's Bookshelf**

Special Annual Issues

New Chemicals—New Equipment Issue—a catalog of new chemicals, chemical specialties and equipment items introduced during the year, bound into special issue once a year.
Annual Buyers' Guide—800-page directory of complete buying information, listing over 30,000 chemical and equipment items with their sources of supply, trade names, physical properties, formulas, etc. Bound separately for convenient, all-year-round, daily use, but included with year-end issue of Chemical Industries.

No other magazine presents so complete a picture of the chemical process industries.

No other chemical magazine carries so much information so early.

No other magazine demands so little reading time for such extensive news coverage.

CI is the chemical magazine of industrial news significance—

CI not only presents the news in short, clear synopsis—but

CI interprets chemical developments and trends for their present and future significance.
